

Twinmax synchroniser machine

Twin-MKIII

Koffer-MKIII

A correct and proper synchronisation of the carburettor or the fuel-injection system is very important for perfect engine running: smooth engine running, excellent response, no vibrations, optimal mileage and less wear. Compared to other synchron machines the TWINMAX compares the vacuum on both sides with the help of a single pressure sensor (differential pressure gage) and shows the difference on the indicator. Synchronizing with TWINMAX is easy and quick. The result is professional precision. The TWINMAX is * usable on almost every engine * suitable for fuel injection * applicable for any number of cylinders * tune with the highest precision * electronic, there are no moving parts * free of Mercury, springs or weights * its works regardless of the atmospherics * very compact (11 x 8 x 4 cm). The set contains: * 1x TWINMAX MKIII, short operating instruction in English on the instrument, * 2x petrol strong elastic hoses, each one is 70 cm, * 2x connecting nipples, 5 mm for Japanese bikes * 2x connecting nipples, 6 mm for Japanese bikes * 2x connecting tubes for BMW * 1x 9volt brand block battery
